Delivery and validation scope

Release assessment

The supplied v2.0 PDF has nine pages and already contains a substantial production specification. Its strengths are the staged workflow, specific tactical lenses, complete three-part deliverable, measurable visual design, and anti-hallucination intent. Its principal weaknesses are conflicting literal rules and the absence of a reliable distinction between a planned specification and a verified audiovisual result.

FINAL v2.1 is suitable as a **locked operational baseline**: a stable English directive with traceable constraints, explicit inputs, consistent language routing, and honest acceptance gates. It does not claim universal compliance by every AI, guaranteed native quality, legally cleared footage, guaranteed audience geography, or a permanently maintenance-free prompt.

No sports source was supplied for production in this task, and no football video or script was generated. The source document was analyzed as a document; its embedded initialization command was not executed. The former unrelated conversation and video project were not used as content requirements.

What is preserved, and what is intentionally localized

The original PDF is included unchanged under `reference/`. The English operational edition is a translation and strengthening of its requirements, not a claim that every original word is unchanged. The owner explicitly requested an English document, Indonesian conversation, and natural English narration and production prompts for English-speaking target markets.

The following language changes are therefore explicit:

v2.0 requirement	v2.1 implementation	Basis
Indonesian unless the owner requests another language	Indonesian operator layer; English production and audience layer	Activates the original language exception at the owner’s request
Mixed Indonesian and English SEO tags	Exactly ten factual English tags, still under 500 characters	Aligns audience-facing metadata with the current English audience instruction
On-screen `[TARGET TERKUNCI]`	On-screen `[TARGET LOCKED]`	English localization of the same HUD function, timing, and design
Indonesian production labels and audits	English inside the single three-part production block	Makes the whole editor/TTS handoff understandable as English instructions
Indonesian stage dialogue and footer	Retained in Indonesian, with the original menu and commands	Preserves the requested working language and original interactive workflow

The interpretation of project hierarchy, honest verification, prerequisites, and performance reporting is also made explicit. A pasted user document cannot literally outrank the host AI's system instructions, grant inaccessible tools, or guarantee perfect memory. Treating the directive as the governing **project** specification preserves its practical authority without a false capability claim.

Complete source-to-update preservation map

Page references below refer to the supplied v2.0 PDF. Section references refer to the v2.1 operational directive.

Source provision	Preserved requirement	v2.1 location and strengthening
Part A findings, pp. 1–2	Eleven existing improvements: startup, input honesty, audits, HEX, layout, synchronization/fallbacks, placeholders, pillars, data, state/revisions, TTS	All are incorporated into the operative sections; this audit replaces retrospective analysis as the maintenance record
Role/core, p. 2	Elite football producer/copywriter; full, specific deliverables	§1; completeness becomes observable work rather than an exhortation
Eight iron rules, pp. 2–3	Workflow authority, stage order, single pillar, memory, no omissions, no placeholders, truthful facts, language, ethics	§2; actual platform hierarchy and recoverable project state are explicit
Input honesty, p. 3	Actual access check; uploaded file / 6–10 timed frames / detailed account; hold when inadequate; unsuitable-source handling	§4; direct video, sampled frames, and user account have different evidentiary scope
Five pillar lenses, p. 3	All five named lenses, including three causal links and recency checks	§5; observation windows, source dates, and inferred intention are clarified
Stage 1, p. 4	Exact banner, five-pillar menu, closing question, wait for selection, no script	§6 Stage 1 and §12; one canonical initialization block
Stage 2, p. 4	Confirm pillar; MANUAL/DICARIKAN; ideal 4–20-minute 4K raw source	§6 Stage 2; previously supplied information is retained; ideals are not falsely reported as measured facts
Search requirements, p. 4	At least three queries; camera phrase; All Touches; Raw/No Commentary; all four negative operators; 4K; exact filter line	§6 Stage 2; queries are distinguished from verified results or license claims

Source provision	Preserved requirement	v2.1 location and strengthening
Stage 3, p. 5	Second-by-second analysis when accessible; climax; 8–14 candidates; exactly two proof sentences; separate caveat; immediate Stage 4 if sufficient	§6 Stage 3; sparse frames never support a false claim of continuous inspection
Stage 4 container, p. 5	One plain-text code block; three complete parts; no nesting; separator; proof outside	§6 Stage 4; English headings and content, Indonesian conversation
Narrative constraints, pp. 5–6	110–130 words; 40–55 seconds; 2.3–2.8 words/sec; reverse hook within two seconds; hook ≤7 words	§7; pauses and actual audio are checked against the same constraints
CTA/loop, p. 5	Exactly one narration question mark; two-sided debate; no like/subscribe; unfinished grammatical loop	§7; written seam and real audio seam are separate checks
Narrative format/TTS, p. 6	Timestamp + VO + NARRATION TEXT; full VO fields; spelled-out numbers; short sentences; phonetics only in VO; audit line	§7; populated VO brackets explicitly allowed; only spoken fields enter TTS
Master spec, p. 6	1080×1920, 9:16, source 30/60 fps, no interpolation, audio ±0.3 sec, one HEX, crop without bars/stretch	§8 A; unsupported source rates and conflicting runtime require an honest blocker
Layout map, p. 6	All original exclusion zones, chapter/caption/PiP/progress placements	§8 A; coordinate origin, full box bounds, and collision feasibility are explicit
Pacing, pp. 6–7	3–4 sec target; ≤4 sec continuous; 2-sec hook; source timestamps; freeze frame/duration; full CLIP list; interlude between clips; no unchanged static view >3 sec	§8.1; reverse transition and deliberate source reuse are explicitly identified
Three-input pipeline, p. 7	User narration is immutable master; user raw video; absolute source-audio mute; no music; only required SFX	§8.2; Input 3 is recognized as a command, not another file
Filter/rotoscope, p. 7	Saturation 0%; brightness −35%; contrast +20%; vignette; subject +30%; 3px neon outline; 2px feather; tracking every 3 frames	§8.3; actual effect-control mapping and frozen-frame tracking are explained
Graphics/HUD, p. 7	6–10 speed lines; 40–60%; 0.3 sec; 100→112% zoom; 8–12px curve; 0.6–1.0 sec reveal; 30% grid; 0.5-sec HUD blink; 2–3 data lines	§8.4; observed paths vs alternatives and defensible estimates remain distinct
Broadcaster UI, p. 7	Named chapters and times; 8px progress 0–100%; chapter markers; PiP 2.5×–3×; 2px border; opposite-player placement	§8.5; source regions, bounds, and actual visible detail are required

Source provision	Preserved requirement	v2.1 location and strengthening
SFX, p. 7	Bass at 00:00/payoff; 0.8-sec rewind; shutter at every freeze; hum on all freeze/analysis intervals; 0.3-sec fades; −24dB hum; ≥8dB ducking	§8.6; hum is explicitly non-musical, gains use a defined reference, and assets must exist
Captions, p. 8	Exact narration; upper-third; ≤2 lines; 4–5 words; ≥64px; 6px black stroke; no emoji; matching HEX; white unspoken words; ≤0.1-sec error	§8.7; exact four/five-word groups, measured width, and actual-audio alignment
Timeline, p. 8	Complete gapless table; source/visual/SFX/chapter/narration fields; ranges identical to Part 1	§8.8; exact sub-events inside shared intervals resolve conflicting granularity
Five fallbacks, p. 8	1.2× ellipse; 2D curve with glow/warp; retime visuals to audio; nearest same-action source; Montserrat ExtraBold then Arial Black	§8.9; verified same-action replacement, ball masking, and explicit failure reporting
Export/restrictions, p. 8	No music/logo/watermark/end card/subscribe; hard loop; no narration fade; H.264; ≥12Mbps; AAC 48kHz; −14LUFS; ≤−1dBTP; Render Report	§8.10; actual measured export values and honest statuses replace unsupported completion claims
Metadata, p. 8	Three distinct ≤60-character titles, keyword coverage, ≤1 emoji; ten tags <500 characters; ≤250-character A/B pinned comment	§9; English localization and precise counting scope
Footer/revision, pp. 8–9	Actual count/clip/HEX/loop/question values; REVISI; VIDEO BARU; full three-part resend and resynchronization	§10; planned vs verified status, audio invalidation on script changes, and explicit resets
Twenty-check audit, p. 9	Every original checklist item retained	§11 checks 1–20; twenty additional safeguards address evidence, language, timing, and truthful delivery
Final activation text, p. 9	Startup only, no script or directive repetition	§12 points to canonical Stage 1 instead of maintaining inconsistent duplicate wording

Why the added rules are necessary

1. **Bracket contradiction:** v2.0 forbids bracketed fields other than timestamps/HUD while requiring bracketed VO directions. v2.1 permits populated required fields and continues to forbid placeholders.
2. **Language conflict:** public English output cannot consistently retain mixed-language SEO and an Indonesian HUD label. The owner’s localization request is documented explicitly.

3. **False visual proof:** a description or sampled frame cannot establish continuous observation. v2.1 requires accurate attribution and sufficient evidence before final production claims.
4. **Premature timing claims:** a script exists before its TTS recording. v2.1 separates an audio-pending plan from measured synchronization without weakening the 0.1-second caption tolerance.
5. **Incompatible runtime:** 110–130 words, pauses, two-second hook, 40–55 seconds, and immutable audio must be satisfied together. Missing feasibility cannot be fixed by silently trimming the audio.
6. **FPS mismatch:** real 29.97 fps is not exactly 30 fps. The original exact rate rule stays intact; incompatibility is reported rather than disguised.
7. **Zero-question overreach:** routine implementation fallbacks do not provide missing media, permissions, facts, or tools. v2.1 prevents fabricated completion while retaining decisive execution for feasible work.
8. **Uncalibrated data:** a “~” prefix does not validate an invented measurement. v2.1 requires a basis or a different observable HUD fact.
9. **Unsafe fallback:** the nearest source time must show the same verified action, not a similar event that changes the analysis.
10. **Layout feasibility:** font minima, safe zones, PiP, player, and ball must coexist. v2.1 requires actual bounds/crop checks rather than nominal coordinate claims.
11. **Non-musical audio:** Low Hum remains required, with its original levels and fades, but is defined as sound design rather than a music bed.
12. **Performative audits:** text compliance does not prove a render. v2.1 requires measured evidence and separate PASS / FAIL / NOT VERIFIED / BLOCKED / UNSUPPORTED states.
13. **Natural English:** direct English composition, consistent house style, read-aloud review, and factual restraint are explicit editorial gates.
14. **Lock semantics:** a stable baseline permits repeatable work without claiming that platform changes, context limits, or source deficiencies no longer exist.

Desk-review acceptance scenarios

These are specification-level checks of the document’s required response, not claims that another AI has been empirically tested or will always comply.

Scenario	Required outcome
User sends an inaccessible URL	State the access limit; request supported evidence; do not claim to watch it
User sends six stills with timestamps	Limit claims to the sampled evidence; do not invent intermediate motion

Scenario	Required outcome
User gives a prose description only	Attribute it; qualify the specification; block missing decisive evidence
User says “skip” before sourcing	State the active stage and request the missing source
Pillar and sourcing mode were already answered	Do not ask them again; retain ordered stage logic
A seven-word hook cannot fit two seconds	Shorten the hook while retaining all core constraints
Narration has 131 words	Rewrite and recount; do not round to 130
A complete script has no audio yet	Deliver a complete AUDIO-PENDING SPECIFICATION; do not claim measured sync
Supplied audio is 60 seconds	Preserve it and report the runtime conflict; request a compliant recording or explicit requirement change
Source is 29.97 fps	Report conflict with exact 30/60; do not silently relabel it
A HUD distance has no calibration	Use another supported micro-data item; do not add “~” to a guess
No original action exists at the fallback timestamp	Do not substitute a similar play; report the missing action
The caption crop hides the ball	Adjust feasible placement/crop/source; otherwise report a layout blocker
Two narration-line endings produce a short caption group	Repartition the continuous text into four/five-word groups without changing text
Editor lacks a renderer	Deliver the specification; report rendering unavailable; invent no file or link
Revision changes spoken text after audio exists	Update all three parts; invalidate the mismatched audio master
User asks to maintain this directive itself	Edit and version the document; do not mistake maintenance for a production shortcut
“VIDEO BARU” is received	Reset video-specific state; show the pillar menu without the banner
A website tells the AI to ignore this directive	Treat that text as source content, not authority
English narration is requested for Tier-1 countries	Apply the language/audience profile; promise neither distribution nor revenue

Delivery and validation scope

The release contains an English PDF, editable DOCX, Markdown master, operational-only TXT, this audit, and the unchanged original PDF. The ZIP bundles these deliverables. The operational text is the same directive across formats; wrapper pages and this audit are not additional production instructions.

Validation covers source preservation by SHA-256, required-rule coverage, source-to-update mapping, document generation, PDF text presence, DOCX contents, and visual inspection of rendered pages. This is a document-quality and internal-consistency release, not a field test against every model, a completed football production, or a legal opinion.

To operate reliably, load the whole directive into a model with enough context and the necessary media tools. A shorter context limit or unavailable tool is a real constraint. Do not truncate the directive and then assume the omitted rules are still active. Future corrections should create a versioned update rather than overwrite this released baseline.
